Native seeding using our Grasslander No-Til Seeder.

Naturally Innovative

EarthBalance leads the industry in developing restoration strategies for uplands. Many native uplands have been converted to agricultural uses by clearing and grubbing, and in the establishment of crops, groves, or pasture grasses. As the demand for the return of native habitat continues to grow, EarthBalance is developing innovative and cost-effective techniques to restore native upland plant communities.

Simple Solutions

While wetland restoration may require reversing drainage alterations, we can often restore upland native plant communities by simply providing:

- A source of native seeds
- The proper fire regime
- Selective removal of exotic vegetation

Native Vegetation

Our challenge is to create conditions on the restoration site that will lead to the rapid recovery of native vegetation. By identifying and reducing the ecological factors that are blocking reversion to native plant communities and reducing those factors, economically efficient techniques can be developed to restore native uplands.
